

Analysis (ERD and accompanying explanation)

Updates made: Removed dateConnected because I wanted less attributes.

Entities:

- Connection – Table storing the connection’s name, position, and date connected
Phone number, and email
- Note – Table storing the notes taken on the different connections or Companies
and the date the note was taken.
- Company – Table Storing names of different companies the connections can work
in.

Relationship:

- InCompany connects the business connections to the company they work in/are
connected to, so a person can work in/be connected to many companies, for
example, Elon Musk and Twitter, SpaceX, and Tesla.

Attributions:

- Connection has the attributes: name (the name of the connection), position (what
position this connection has in their job), phoneNumber (the connection’s phone
number), email (the connection’s email)
- Note have the attributes: text (The note made on the connection, for example,
where they met and what they talked about or thing this person is good at.) and
dateTaken (The date this note was taken).
- Company has the attribute: companyName (name of the company)
